Reasons for Allowance

2. The claims 1, 2, 4, 6-8, 25-36 are considered allowed.
3. The following is an examiner's statement of reasons for allowance.

The prior art references most closely resembling the applicants claimed invention is Helgeson (U.S. 2002/0073236) and O'Brien et al (U.S. 6,351,776).

First, Helgeson disclosed a solution to the needs described above through a system and method for managing data exchange among systems into a network. The systems and methods of the present invention translate data from a system specific local format to a generic interchange format object, and vice versa, with predefined style sheets using generic components and However Helgeson failed to disclose, "Scanning the source code of the transaction-based mainframe application and identifying the transaction and the related information, wherein the transaction-based mainframe application originally does not process transaction over a World Wide (Web); storing in a database the related information identified in the scan of the source code, hereinafter identified information; extracting from the database parameter, said parameter usage type selectable from the parameter usage type set comprising input, output, input/output, and unreferenced, hereinafter identified information; displaying the transaction and a subset of the related information and the extracted information; receiving user input selecting the transaction; and in response to receiving the user input generating a communication area file that

includes a definition and a declaration of the data to be passed to and from the transaction-based mainframe application and a documentation file that provides documentation that describes the communication area file using the identified information and the extracted information' and with the computer building tool, parsing the communication area file; and building a connector using the identified information and the extracted information, wherein the transaction-based mainframe application is enabled to process transaction over the Web ". These limitations are incorporated into all of the independent claims (claim 1).

Second O'Brien disclosed, "The Shared Internet Storage Resource provides Internet based file storage, retrieval access, control, and manipulation for a user. Additionally, an easy-to-use user interface is provided both for a browser or stand-alone application. However O'Brien did not disclose, "Scanning the source code of the transaction-based mainframe application and identifying the transaction and the related information, wherein the transaction-based mainframe application originally does not process transaction over a World Wide (Web); storing in a database the related information identified in the scan of the source code, hereinafter identified information; extracting from the database parameter, said parameter usage type selectable from the parameter usage type set comprising input, output, input/output, and unreferenced, hereinafter identified information; displaying the transaction and a subset of the related information and the extracted information; receiving user input selecting the transaction; and in response to receiving the user input generating a

communication area file that includes a definition and a declaration of the data to be passed to and from the transaction-based mainframe application and a documentation file that provides documentation that describes the communication area file using the identified information and the extracted information' and with the computer building tool, parsing the communication area file; and building a connector using the identified information and the extracted information, wherein the transaction-based mainframe application is enabled to process transaction over the Web". These limitations are incorporated into all of the independent claims (claim 1).

In summary, the Examiner submits that Helgeson-O'Biren did not teach all the limitations of independent claims in combination with other elements. Specifically prior art does not teach "Scanning the source code of the transaction-based mainframe application and identifying the transaction and the related information, wherein the transaction-based mainframe application originally does not process transaction over a World Wide (Web); storing in a database the related information identified in the scan of the source code, hereinafter identified information; extracting from the database parameter, said parameter usage type selectable from the parameter usage type set comprising input, output, input/output, and unreferenced, hereinafter identified information; displaying the transaction and a subset of the related information and the extracted information; receiving user input selecting the transaction; and in response to receiving the user input generating a communication area file that includes a definition

and a declaration of the data to be passed to and from the transaction-based mainframe application and a documentation file that provides documentation that describes the communication area file using the identified information and the extracted information' and with the computer building tool, parsing the communication area file; and building a connector using the identified information and the extracted information, wherein the transaction-based mainframe application is enabled to process transaction over the Web"; therefore, claims 1, 2, 4, 6-8, 25-36 have been deemed allowable over the prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
